

Verdant Grid

Forecasting software that keeps distributed energy grids stable.

Seed round — 2026

The Problem

US utilities curtailed 8.2 TWh of renewable generation in 2025 because they cannot forecast distributed solar and battery output hour-by-hour. Curtailment cost operators an estimated \$1.4B last year. Legacy SCADA forecasting tools were built for centralised thermal plants.

Our Solution

Verdant Grid ingests smart-meter and inverter telemetry and produces 15-minute-resolution generation forecasts per feeder.

Deployed as a read-only SaaS layer alongside existing SCADA - no utility-side hardware, no control-plane integration, no NERC CIP scope.

Mean absolute error of 4.1% vs 11.7% for the incumbent baseline.
